

## Energy Policy

We use energy rationally, providing the necessary information and resources to monitor energy use and target achievement. We commit ourselves to continuously improve energy-related performance.

We motivate all employees to act in an energy-conscious manner both inside and outside the company.

By reducing the energy consumption, we also cut the CO<sub>2</sub> emissions, making an active contribution to climate protection. We optimize energy efficiency in the course of our continuous improvement processes and thereby ensure competitiveness at the site. We undertake to comply with all legal requirements

We also want to use our energy efficiency activities as an element of marketing and to realize potentials for cost reduction. When procuring production equipment, we take energy efficiency into account and ensure that production is as energy-efficient as possible by using state-of-the-art manufacturing technologies.

We want to make our contribution to the efficient use of energy in the long term and support politics within the framework of a reliable energy supply. Strategic and operational energy targets form the framework for the individual measures to improve energy efficiency.
